Since 1994, Formadrain Inc. has operated in developing and implementing No-Dig technologies, including its proprietary CIPP system. Thousands of pipes and sewers have been repaired or replaced with Formadrain technology in Canada and the United States. Trenchless technology with Formadrain's No-Dig System is an accurate no-dig technology for sewer repair; it utilizes steam curing, allowing cure times of 45 minutes to 1 hour, offering significant advantages with time and cost savings. The liners can be pushed into place with only one access point or between any two access points (cleanouts, maintenance holes, etc.). Pulled-in-place is often the preferred method, as two lifelines are available for adjustments. The pulled liner will negotiate Ts and Ys quickly and bends up to 90 degrees. Our liners also adapt to any size transition. All conduits can be lined with FORMADRAIN — fast, economical, and durable.
